

LUNG CANCER

Leading Cancer Killer in Both Men and Women

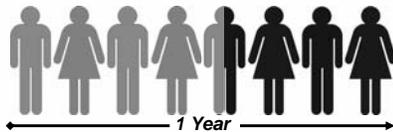

More people die from lung cancer each year in the US than from breast, colorectal and prostate cancers combined¹.

Top 4 Cancers with Highest Death Rates

In the US, more than 149,000 people will die in 2020 from lung cancer with more than 221,500 new cases being diagnosed. In Illinois, Kentucky and Missouri alone, more than 13,200 people will die from this disease in 2020 with more than 19,800 new cases being diagnosed².

More than half of people diagnosed with lung cancer die within one year of being diagnosed¹.

If detected early when localized in the lungs, the five-year survival rate for lung cancer is 56 percent¹.

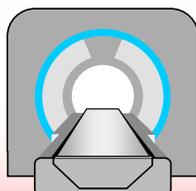

Lifetime Chance of Getting Lung Cancer

These numbers include both smokers and non-smokers. For smokers the risk is much higher, for non-smokers the risk is lower³.

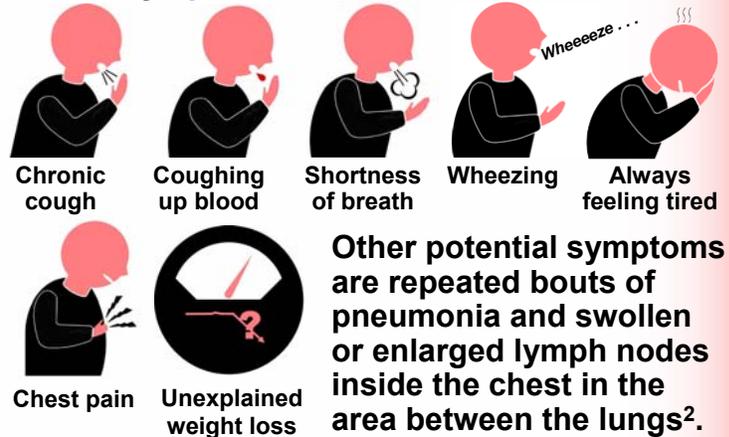

Early detection, by low-dose computed tomography screening, (LDCT) can decrease lung cancer mortality by 14 to 20 percent among high-risk populations¹.

~ See your physician to find out "what's right for you" ~

Lung Cancer Symptoms

Most people with lung cancer don't have symptoms until the cancer is advanced. Lung cancer symptoms may include²:

Risk Factors

Cigarette smoking is the number one risk factor for lung cancer. In the United States, cigarette smoking is linked to about 80% to 90% of lung cancers².

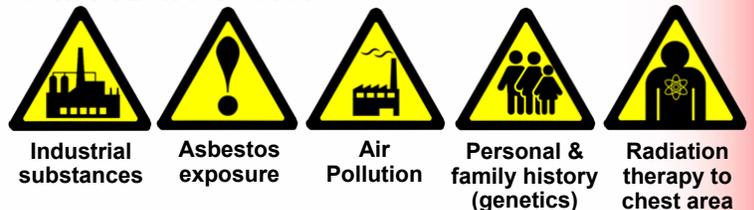

Nonsmokers exposed to secondhand smoke increases their risk of developing lung cancer by 20–30%².

The leading cause of lung cancer in non-smokers is exposure to radon that is a naturally occurring radioactive gas that you can't see or smell⁶.

Other Risk Factors:

Industrial substances can include arsenic, uranium, beryllium, vinyl chloride, nickel chromates, coal products, gasoline, and diesel exhaust⁴.
