

LUNG CANCER

Leading Cancer Killer in Both Men and Women

More people die from lung cancer each year in the US than from breast, colorectal and prostate cancers combined¹.

Top 4 Cancers with Highest Death Rates

In the US, more than 125,070 people will die in 2024 from lung cancer with more than 234,580 new cases being diagnosed. **In Illinois alone, more than 4,910 people will die from this disease in 2024 with more than 9,430 new cases being diagnosed².**

More than half of people diagnosed with lung cancer die within one year of being diagnosed¹.

If detected early when localized in the lungs, the five-year survival rate for lung cancer is 63 percent³.

Lifetime Chance of Getting Lung Cancer

These numbers include both smokers and non-smokers. For smokers the risk is much higher, for non-smokers the risk is lower³.

Early detection, by low-dose computed tomography screening, (LDCT) can decrease lung cancer mortality by at least 20 percent among **high-risk populations¹**.

~ See your physician to find out "what's right for you" ~

Lung Cancer Symptoms

Most people with lung cancer don't have symptoms until the cancer is advanced. Lung cancer symptoms may include²:

Risk Factors

Cigarette smoking is the number one risk factor for lung cancer. In the United States, cigarette smoking is linked to about 80% to 90% of lung cancers¹.

Nonsmokers exposed to secondhand smoke increases their risk of developing lung cancer by 20–30%¹.

The leading cause of lung cancer in non-smokers is exposure to **radon** that is a naturally occurring radioactive gas that you can't see or smell⁶.

Other Risk Factors:

Industrial substances can include arsenic, uranium, beryllium, vinyl chloride, nickel chromates, coal products, gasoline, and diesel exhaust⁴.
